Engineering leader with 10 years across Apple, Meta, and Google, now directing engineering at an early-stage energy company. Took an organization with no source control and vendor-held infrastructure through its first SOC 2 certification, repeatable multi-environment delivery, and production observability. Has led vendor engineering teams for a decade, at Apple and today. Sets technical direction and engineering process, and still designs and ships production systems.

TECHNICAL SKILLS

Engineering Leadership & Architecture: Technical strategy, architecture assessment, vendor engineering team leadership, hiring requirements and interview rubrics, onboarding design, code review standards, release gates, executive communication, business requirements

Cloud & Platform: AWS (ECS, IAM, SSM, OIDC), Docker, Terraform, GitHub Actions, CI/CD, multi-environment release management

Reliability & Production Engineering: Completion-aware observability, root cause analysis, failure-mode remediation, concurrency defects (race conditions, deadlocks), background job and worker reliability, production validation

Security & Compliance: SOC 2 certification, single sign-on, SAST, dependency scanning, vulnerability remediation, secrets management

Backend & Asynchronous Systems: REST, GraphQL, gRPC, WebSockets, API design, background job and worker architecture, concurrency, asynchronous processing

Languages & Frameworks: Python (Django, DRF, FastAPI), TypeScript, JavaScript (React, Next.js, Node.js), Java (Spring Boot), SQL

AI-Assisted Engineering: Production infrastructure delivery and rapid analysis of inherited codebases using Claude Code

PROFESSIONAL EXPERIENCE

Director of Software Engineering, Future Energy Enterprises – Berkeley, CA Oct 2025 – Present

- Inherited an engineering organization with no source control and an AWS account held by an outside vendor; established a Git workflow, brought the account under direct company control, and remediated audit findings including credential handling that belonged in AWS SSM and an unsafe deletion policy
- Replaced manual container deployment to ECS with automated delivery across dev, staging, and production, scoped and built in about a week after declining an external proposal of roughly 600 hours for the same work; the pipeline has since carried 80+ deployments in 3 months under controlled production promotion
- Led the engineering side of the company's first SOC 2 certification and the controls that sustain it, covering single sign-on, SAST, dependency scanning, and continuous vulnerability remediation
- Traced recurring production failures to a systemic gap between job execution and verified completion, where invoking a background job was treated as evidence the work had succeeded; introduced completion-aware observability into a system that had none, and remediated the underlying failure modes including swallowed exceptions, silent worker failures, race conditions, and database deadlocks
- Absorbed roughly 50% of the engineering scope previously owned by an outside vendor, while leading 10 external vendor engineers across 2 vendor engineering teams and 1 direct report
- Established the engineering practices the organization now runs on: hiring requirements and interview rubrics, a wiki-based bootcamp and onboarding guide, documented code review standards, and release gates; personally trained 3 new hires into that system
- Authored business requirements and the technical proposal for a prospective project representing up to \$5M in potential revenue

Technologies: Python, Django, FastAPI, React, AWS (ECS, IAM, SSM, OIDC), Docker, Terraform, GitHub Actions

Tech Lead, Apple Online Store (Contract) – Sunnyvale, CA

Nov 2022 – Oct 2025

- Managed roughly 20 vendor engineers delivering Apple Online Store ordering and services, running the engineering operating rhythm across squads on a revenue-carrying path
- Converted ambiguous executive goals into explicit technical tradeoffs across speed, reliability, and cost, and held the line on which of them the ordering path could absorb
- Reduced external dependency by using AI-assisted code analysis to build internal understanding of vendor-owned critical paths the team was accountable for but had not authored, then bringing those paths in-house

Technologies: JavaScript, Amazon Athena

Developer Support Engineer Manager, Meta — Instagram Business Support Apr 2021 – Nov 2022

- Led 40 engineers and managers across APAC and EMEA training programs, reducing ramp time by 40 hours per person and raising user satisfaction 25% across managed surfaces
- Directed GTM strategy for Instagram Reels and WhatsApp Pay across India and South America, translating advertiser and end-user needs into product and engineering requirements

Lead Engineer, Apple Online Store (Contract) – Sunnyvale, CA 2019 – 2021

- Led technical delivery of an online payment-flow improvement, acting as informal manager for the vendor engineering team and contributing to a 15% engagement lift
- Delivered the engagement 10% under budget through scope discipline and prioritization against measured outcomes

ADDITIONAL EXPERIENCE

2018 – 2019: Application Developer, Google via Accenture (Contract), Mountain View, CA — supported Google's developer and partner community on API issues, resolving reported defects through direct client correspondence

2017 – 2018: Quality Assurance Tester, PayPal via Intelliswift (Contract), San Jose, CA — tested REST APIs using Postman and maintained supporting documentation

2016 – 2017: Senior Associate App Developer, UnitedHealth Group, Cypress, CA — unit testing and code review across applications under both Agile and Waterfall delivery

2015: TDP Intern, Optum Technology, Hartford, CT — built the J2EE backend for a major application portal, coordinating deliverables across teams in 3 countries

PROJECTS

security-cicd-templates — Reusable GitHub Actions workflows for SAST, dependency scanning, and OIDC-based ECS deployment, consumed by other repositories through a single reference rather than rebuilt per project
github.com/jaysingh10406/security-cicd-templates

SOC 2 Control Tracker — FastAPI, SQLAlchemy, and React dashboard modeling trust-service control status, ownership, and audit readiness, built from the controls established in the SOC 2 certification above
jaysingh10406.github.io/soc2-control-tracker

EDUCATION

Master of Business Administration, Product Management June 2024
 Louisiana State University — Shreveport, LA

Bachelor of Arts in Computer Science May 2016
 Central Connecticut State University — New Britain, CT
